

# PRIVATE BUS PORTAL

## **ABSTRACT**

Today, every information is available to us through the help of internet. All our planning for travel depends majority on the public transport system present. As nearly all our day to day activities are all done through with the help of internet. Through this project we are trying to make an public online system with the help of which we are able to track the timings of private buses. So that we are proposing a system that brings the information about most common means of transport in our country to an fingertip distance. The main objective of this project is to track the timings of private bus service in Kerala. Users who have not their valid login id and password can make new registration and get their id and set password as per choice. The main objective of the login module is to keep each passenger safe which will not allow making fraud and make their transactions secure. When all the selection work will be done, passengers will be provided with the total fare charges and mode of payment which they want to select for making final payment. A major component of this project is reservation of the tickets and seats to the passengers. It provides better and efficient service to the admin working or controlling the passenger.
